

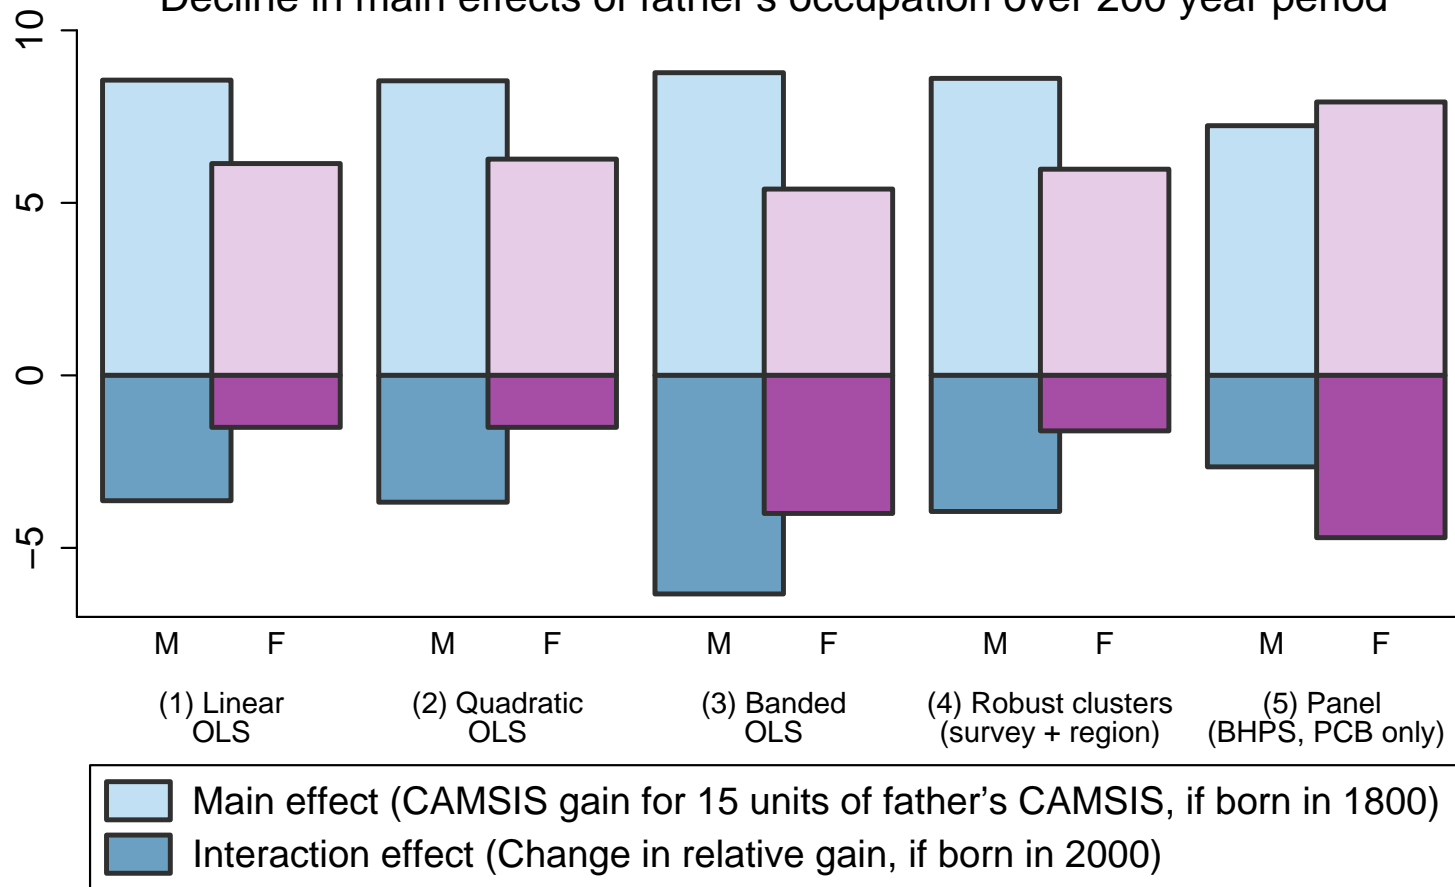

Figure 6: Intergenerational interaction effects

Decline in main effects of father's occupation over 200 year period

Source: Data as Table 2, panel duplicates excluded 1–4. Model 1, N=110319 men, 67344 women.
 Regression: own CAMSIS = father's CAMSIS[F] + age + year of birth[Y] + Y.F interaction.
 Models 1, 4, 5 fit Y.F as linear effect, model 2 as quadratic, model 3 uses 10-year bands.
